**Re: Supplemental River Sediment Investigation
Former Hammond MGP Site
Hammond, Indiana
ThermoRetec Project No. NIPS2-03933-250**

Dear Brian,

This letter report, including attachments, summarizes the activities and reports the findings of the supplemental river sediment investigation of the former Hammond MGP Site in Hammond, Indiana (Figure 1). The details regarding previous investigations are covered in the *River Sediment Investigation Report, Grand Calumet River, Hammond, Indiana*, dated January 14, 1999 (ThermoRetec Project No. 3-3933-600). The purpose of the current investigation was to further delineate the presence, extent, and concentrations of the constituents of interest (COI) in the river sediments adjacent to the site.

Field activities, completed June 14-16th, 1999, included mobilization and demobilization of a pontoon barge on the Grand Calumet River, completion of 12 river sediment cores between the Hohman Avenue and railroad bridges, and collection and archiving of river sediment samples for chemical analysis. The sediment cores were obtained using hand-pushed, 2 inch PVC pipe with a Waterloo type plunger (to maintain the integrity of the sediment sample). The pipe was advanced to either 6 feet (ft) below the top of sediment (bts) for shallow cores or 10 ft-bts for deep cores. Recovery of sediment ranged from 4.5-7.5 ft for both shallow and deep cores. Complete descriptions of the sediment sampling can be found in the attached boring logs. The sampling location coordinates are listed in Table 1 and each location is depicted appropriately on both Figures 2 and 3.

Multiple samples from each sediment core were collected and submitted for chemical analysis or archived at the laboratory (Test America, Inc., Indianapolis, IN). For shallow sediment cores, two 4-ounce sample jars were filled with a composite sample from 0-6 ft-bts. These composite samples were analyzed using the toxic characteristic leaching procedure for benzene (TCLP-benzene). Sediment samples from 0-3 ft-bts and 3-6 ft-bts were also collected in separate 4-ounce jars and archived. For deep sediment cores, the same sampling regime was implemented with additional samples collected in 4-ounce jars and submitted for analysis of benzene, toluene, ethylbenzene, and xylenes (BTEX) and polycyclic aromatic hydrocarbons (PAHs), using USEPA SW-846 methods 8021B and 8270C, respectively. Samples were also collected from the lower portion of the deep sediment cores for physical characterization, however, the laboratory was unable to perform these analyses due to the highly impacted nature of the samples.

The results of the chemical analysis are listed in the attached tables and laboratory report. Included in both tables are the respective Tier II Cleanup Goals for the Nonresidential Scenario for the State of Indiana (Tier II Criteria). Table 2 contains results from the TCLP-benzene analysis and Table 3 contains results for BTEX and PAHs analyses. The complete analytical results for all samples can be found in the attached laboratory report from Test America, Inc.

Visual inspection of the river sediment samples indicated that impacted strata and product layers existed throughout the core lengths. Chemical analysis confirmed the presence of benzene in the composite samples. Eight of the twelve composite samples (SD-99-03, -04, -05, -06, -07, -08, -09, and -11) had TCLP-benzene concentration above the Tier II Criteria of 0.5 mg/L (Figure 2). The concentrations for these samples ranged from 0.76 - 3.1 mg/L. The other four samples (SD-99-01, -02, -10, and -12) had benzene concentrations just below the Tier II Criteria, ranging from 0.40 - 0.48 mg/L.

Chemical analysis of the non-composite samples confirmed the presence of BTEX in all five samples submitted (including one duplicate). Benzene concentrations reported for SD-99-06-4-5' and its duplicate DUP-99-01 were 6.9 and 5.5 mg/kg, both of which are above the Tier II Criteria of 4.77 mg/kg (Figure 3). Benzene concentrations for SD-99-01-0-3', SD-99-01-3-6', and SD-99-09-5-6' were 4.6, 2.3, and 4.1 mg/kg, respectively, and are below the Tier II Criteria. Concentrations for toluene, ethylbenzene, and xylenes were below the Tier II Criteria for all five samples.

The presence of PAHs in non-composite samples was also confirmed by chemical analysis. Concentrations of benzo(a)anthracene and benzo(a)pyrene were above the Tier II Criteria in

Mr. Brian Stage
September 7, 1999
3 of 3

samples SD-99-01-0-3' and DUP-99-01 (Figure 3). The respective concentrations of benzo(a)anthracene were 170 and 130 mg/kg, with a Tier II Criteria of 103.88 mg/kg. The respective concentrations of benzo(a)pyrene were 120 and 89 mg/kg, with a Tier II Criteria of 69.85 mg/kg. The original sample of DUP-99-01, SD-99-06-4-5', did not exceed the Tier II Criteria for benzo(a)anthracene and benzo(a)pyrene, but the values (89 and 65 mg/kg, respectively) were close to the Tier II Criteria.

The quality assurance and quality control (QA/QC) samples returned expected results. The equipment blank and the trip blank reported no detectable levels of BTEX compounds or PAHs, indicating that no contamination of the samples occurred via the sampling equipment or during storage and transportation to the laboratory. The matrix spike/matrix spike duplicate samples were out of the control limits due to matrix interference.

In conclusion, the river sediments adjacent to the former Hammond MGP site are impacted with the COI and exceed the Tier II Criteria for the compounds and locations as described above. This site, at your discretion, should receive further attention in regards to these exceedances. Should you or your staff have any questions regarding the information contained in this report, please contact us at your convenience.

Sincerely,

ThermoRetec Consulting Corporation

PROJECT NARRATIVE

JOB NUMBER: 99.03367

SAMPLE: ms241009, msd241009

ANALYSIS: 8270-PNA

Some spike compounds in matrix spike and spike duplicate were out of control limits due to matrix interferences.
xia

SAMPLE: SD-99-03-4-6', SD-99-06-5-6', SD-99-09-6-7'

ANALYSIS: GRAINSIZE AND ATTERBERG LIMITS

The above tests could not be performed due to the petroleum content which caused the samples to not disperse in water and to repel water.
